SUMMARY

AI Engineer who turns ambiguous, resource-constrained problems into working, production-facing systems spanning forecasting models, real-time computer vision, IoT-to-cloud pipelines, and LLM-powered agentic workflows. In under a year, has independently taken systems from a zero-historical-data starting point through to live deployment, architecting agentic decision pipelines built on LLM function calling and modern agent frameworks (LangChain, LangGraph, CrewAI, MCP), and shipping forecasting models that scored 89% and 80% on evaluation. Comfortable being the sole technical voice translating trade-offs for business stakeholders, and building end-to-end with minimal senior oversight. Brings depth across classical ML, deep learning and computer vision (including Transformer-based architectures), and Generative AI, with equal fluency in the model, the pipeline, and the business problem it serves.

CORE SKILLS

AI & ML: Machine Learning, Deep Learning, Computer Vision, Transformers, Time-Series Forecasting, LightGBM, LSTM, OpenCV, YOLOv8

AI & Agentic Systems: Agentic Workflows (LangChain, LangGraph, CrewAI), Model Context Protocol (MCP), Tool Calling / Function Calling, RAG Systems, Vector Databases (FAISS), Prompt Engineering & Evaluation

Tools & Environments: Cursor, Claude API, Antigravity, Hermes, Docker, FastAPI, Git, CI/CD (Foundation)

Consultative & Delivery: Client Technical Demos, Requirements Gathering, Agile/Scrum, Stakeholder Communication

Software & Systems: Python, ReactJS, TypeScript, SQL, GraphQL (Foundation)

EXPERIENCE

EAGE Technologies India Pvt. Ltd.

Bengaluru, KA

AI Software Engineer

Jul 2025 – Present

- Built and benchmarked LightGBM and LSTM forecasting models for solar power output using 12 years of location-based historical data, reaching evaluation scores of 89% and 80% respectively, and designed retraining triggers and performance-ratio-based drift monitoring.
- Architected an agentic decision pipeline integrating LightGBM/LSTM forecasts with rule-based risk logic and LLM function calling, generating real-time operational directives and automated risk alerts for solar assets.
- Built a real-time computer vision pipeline (YOLOv8, InsightFace, FAISS) for face detection, distance estimation, and object detection, engineered as an independent software pipeline, with STM32 hardware connected to the system to complete the end-to-end hardware-software pipeline for a client defense application.
- Designed an IoT-to-cloud Agri-Soil Intelligence engine under zero-historical-data constraints, engineering cold-start threshold logic and location-based climate API pipelines for 2 pilot locations.
- Interfaced directly with client stakeholders and engineering leads to translate complex operational needs into technical specifications and deploying pilot systems in live customer environments.
- Conducted applied research and development of machine learning and deep learning solutions across predictive analytics, computer vision, and forecasting use cases.
- Evaluated model performance through experimentation and data analysis to guide solution design decisions.

Code Nimbus Solutions Pvt. Ltd.

Bengaluru, KA

AI & Frontend Intern

Sep 2024 – Jun 2025

- Built AI-powered facial recognition pipelines using deep learning and embedding extraction techniques.
- Developed user interfaces for AI applications, enabling visualization of model outputs and operational workflows.

PROJECTS

Solar Intelligence Platform: Forecasting and decision-support platform combining LightGBM and LSTM models (89% / 80% evaluation scores) trained on 12 years of historical data with rule-based risk analysis and an LLM-generated advisory layer, designed with retraining triggers and drift-detection monitoring.

Soil Intelligence Platform: IoT-to-cloud agricultural advisory system using GSM-based sensor data and location/climate APIs, threshold-based rule engine for soil health, crop recommendation, and disease risk across two pilot locations, built in the absence of historical data.

Defense Surveillance: Real-time computer vision system integrating pretrained YOLOv8, InsightFace, and FAISS for face detection, distance estimation, and object detection (including IR images), built as a standalone software pipeline, with STM32 embedded hardware connected to the system to complete the hardware-software pipeline.

EDUCATION

SDM Institute of Technology

Ujire, Dakshina Kannada, KA, India

B.E. in Artificial Intelligence & Data Science · 2021 – 2025 · CGPA: 7.69
